Loved by women for their natural look and feel.

see sarai's story

Sarai, Actual Sientra Patient

“ After finding out I had cancer and needed to have my breasts removed, I was scared of the future. I didn't know my reconstruction options until my surgeon explained the procedure and results.

I'm so glad I got Sientra implants: they look better than my natural breasts used to look. I love and accept myself when I look in the mirror; I look so natural and real, both with clothes and without. Having breasts after battling breast cancer has helped my mental and emotional health, and I can feel like myself: confident, happy and proud of where I have been.

My implants look and feel like my own breasts. After only 3 months of my mastectomy with immediate reconstruction, I rarely ever think I don't have breasts. I am very comfortable and free to enjoy my normal life without worrying about them or feeling insecure.

I am amazed by how well I have healed and how quickly I have become accustomed to my Sientras. Retaining my old breast shape has helped my self-esteem and intimacy. ”

Actual Sientra Reconstruction Patient

breast surgery guide

two-step reconstruction

During the two-step reconstruction method, a temporary breast tissue expander is used to form a new breast pocket which will eventually hold the long-term breast implant.

STEP 1

expansion

Sterile saline is injected through the expander port to slowly stretch the skin creating a pocket for the breast implant.

STEP

WHAT IS BREAST RECONSTRUCTION?

Breast reconstruction is a surgical procedure that restores the shape and appearance of a breast. You may consider breast reconstruction following a mastectomy or a lumpectomy.

The most common approach is implant-based reconstruction which uses a breast implant to rebuild breast shape.⁴ Breast reconstruction can either be performed in a one-step procedure, often referred to as direct-to-implant, where the implant is inserted at the time of your mastectomy. Or, more commonly, the reconstruction takes place in two steps.⁴

STEP 2 implantation

Once the pocket is formed (typically within 2 - 6 months following surgery) the tissue expander is removed and replaced with a long-term breast implant.⁵

IMPORTANT SAFETY INFORMATION

Sientra's Silicone Gel Breast Implants are indicated for breast augmentation in women at least 22 years old and for breast reconstruction. Breast augmentation includes primary breast augmentation to increase the breast size, as well as revision surgery to correct or improve the result of primary breast augmentation surgery. Breast reconstruction includes primary reconstruction to replace breast tissue that has been removed due to cancer or trauma or that has failed to develop properly due to a severe breast abnormality. Breast reconstruction also includes revision surgery to correct or improve the results of a primary breast reconstruction surgery. Breast implant surgery is contraindicated in women with active infection anywhere in their bodies, with existing cancer or pre-cancer of their breast who have not received adequate treatment for those conditions and, who are pregnant or nursing. Key complications include capsular contracture, implant removal, rupture and reoperation. For more detailed information about the risks and benefits of Sientra breast implants, please visit sientra.com/resources or call Sientra at 888.708.0808. Sientra breast implants with high-strength cohesive silicone gel are only available through board-certified or board-eligible plastic surgeons.
